The Rhumb Line of Symbolism Laurent Le Sage 1978 The self-styled Symbolist poets, this book holds, represent only an articulate phase of a steady course in French poetry from the Romantic period to the present. The direction taken by Romanticism, broadly defined, is that of the intuitive as against the rational, the subjective as against the objective—with a constant orientation toward individual liberty. Thus Symbolism can be properly placed in the line of all mystical, oracular, illuminist, or idealist traditions. In this broad view Symbolism includes both some of the greatest writers of 19th-century France and also many of the chief creative geniuses of the modern world. Viewed narrowly, the Symbolists are merely a swarm of poets grouping and regrouping themselves in the final fifteen years of the past century into ephemeral crews—Hydropaths, Hirsutes, Decadents, and other anti-Parnassians—with no poetic genius at the helm. The aim of this book is to reconcile the broad and narrow views of Symbolism. Its method is to give the ideas and experiences of twenty poets representative of the movement, together with a selection from their writings. Lying at the heart of Symbolist doctrine is the symbolic image. Since Symbolist poets have assumed phenomena to have symbolic value as indications of the world of ideas behind the world of appearances, they have deemed their role to be the revelation of this higher reality through symbolic imagery. First come three Romantic precursors: Sainte-Beuve, who exploited the vein of the humble and familiar; Bertrand, who used the quaint and the grotesque; and Nerval, who incorporated alchemy. Following the pantheistic Guérin come the three Symbolist wizards: Baudelaire, Mallarmé, and Verlaine. Next come the two savage poets, Rimbaud and Lautréamont, and eight of the poets prominent in the heyday of the movement. The line leads to Valéry and Claudel, 20th-century geniuses of symbolist heritage. In addition to the presentation and selected texts, all poems are annotated, and a reading list is given for each poet.

A Critical Bibliography of French Literature David Baguley 1994-02-01 *Pushing the Pencil* Donald Wilcox Thomas 2012-03-06 From the essays Teachers must learn how to push the pencil, effecting ease and simplicity out of hard learning that leaves a deep and permanent impression upon youthful thought. Having high expectations is laudable but woefully inadequate for overcoming the disparities that lurk in the deep recesses of our broad domain. More teaching, whether good or bad, is lost somewhere between class and lunch than could ever be recovered from one year to the next. The best lessons taught end up at the dinner table, not at the end of the period. That teaching is as much an addiction as it is a profession need not be elaborately urged. Teachers though born must nevertheless be made and remade. Schools do not improve teaching; teaching improves schools.

The New International Encyclopaedia Daniel Coit Gilman 1906 **Rhumb Lines and Map Wars** Mark Monmonier 2010-11-15 In *Rhumb Lines and Map Wars*, Mark Monmonier offers an insightful, richly illustrated account of the controversies surrounding Flemish cartographer Gerard Mercator's legacy. He takes us back to 1569, when Mercator announced a clever method of portraying the earth on a flat surface, creating the first projection to take into account the earth's roundness. As Monmonier shows, mariners benefited most from Mercator's projection, which allowed for easy navigation of the high seas with rhumb lines—clear-cut routes with a constant compass bearing—for true direction. But the projection's popularity among nineteenth-century sailors led to its overuse—often in inappropriate, non-navigational ways—for wall maps, world atlases, and geopolitical propaganda. Because it distorts the proportionate size of countries, the Mercator map was criticized for inflating Europe and North America in a promotion of colonialism. In 1974, German historian Arno Peters proffered his own map, on which countries were ostensibly drawn in true proportion to one

another. In the ensuing "map wars" of the 1970s and 1980s, these dueling projections vied for public support—with varying degrees of success. Widely acclaimed for his accessible, intelligent books on maps and mapping, Monmonier here examines the uses and limitations of one of cartography's most significant innovations. With informed skepticism, he offers insightful interpretations of why well-intentioned clerics and development advocates rallied around the Peters projection, which flagrantly distorted the shape of Third World nations; why journalists covering the controversy ignored alternative world maps and other key issues; and how a few postmodern writers defended the Peters worldview with a self-serving overstatement of the power of maps. *Rhumb Lines and Map Wars* is vintage Monmonier: historically rich, beautifully written, and fully engaged with the issues of our time.

Pictorial Communication In Real And Virtual Environments Stephen Ellis 1991-06-04 Advances in the quality and accessibility of computer graphics has provided new pictorial displays and the tools with which to control them. These new display technologies have focused interest on how to design the static and dynamic images they produce to ensure effective communication. This book, based on the conference on Spatial Displays and Spatial instruments held at the Asilomar Conference Centre in 1987, focuses on the geometry of this communication. It is intended to be a source book of theoretical analysis, experimental demonstrations and practical examples from a range of contributors interested in pictorial communication, from medical artists to astronauts. The book offers the theoretical background and practical guidance needed by designers of contemporary 2D and 3D graphical computer interfaces. Its major contribution lies in its outlining of the elements of human perception and motor control which underlie the geometric design of head-mounted graphics for virtual reality displays.

Working with Map Projections Fritz Kessler 2019-05-03 A map projection

fundamentally impacts the mapmaking process. Working with Map Projections: A Guide to Their Selection explains why, for any given map, there isn't a single "best" map projection. Selecting a projection is a matter of understanding the compromises and consequences of showing a 3-D space in two dimensions. The book presents a clear understanding of the processes necessary to make logical decisions on selecting an appropriate map projection for a given data set. The authors discuss the logic needed in the selection process, describe why certain decisions should be made, and explain the consequences of any inappropriate decision made during the selection process. This book also explains how the map projection will impact the map's ability to fulfill its purpose, uses real-world data sets as the basis for the selection of an appropriate map projection, and provides illustrations of an appropriately and inappropriately selected map projection for a given data set. The authors take a novel approach to discussing map projections by avoiding an extensive inventory of mathematical formulae and using only the mathematics of map projections that matter for many mapping tasks. They also present information that is directly applicable to the process of selecting map projections and not tied to a specific software package. Written by two leading experts, this book is an invaluable resource for anyone studying or working with geospatial data, from students to experienced professionals, and will help readers successfully weigh the pros and cons of choosing one projection over another to suit a map's intended purpose.

The Development of Russian Verse Michael Wachtel 1998 The Development of Russian Verse explores the Russian verse tradition from Pushkin to Brodsky, showing how certain formal features are associated with certain genres and, at times, specific themes. Michael Wachtel's basic thesis is that form is never neutral: poets can react positively in terms of stylization and development, or negatively in terms of parody or revision, to the work of their predecessors, but they cannot ignore it. Keeping technical terms to a minimum and providing English translations of quotations, Wachtel offers close readings of individual poems of more than fifty poets. He aims to help English-speaking readers reconstruct the strong sense of continuity that Russian poets have always felt, transcending any individual age or ideology. Ultimately, his 1999 book is an inquiry into the nature of literary tradition itself, and how it coalesces in a country that has always taken so much of its identity from its written legacy.

Collected Poems Stéphane Mallarmé 2011-01-15 In this classic tale, Richard Kim paints seven vivid scenes from a boyhood and early adolescence in Korea at the height of the Japanese occupation, 1932 to 1945. Taking its title from the grim fact that the occupiers forced the Koreans to renounce their own names and adopt Japanese names instead, the book follows one Korean family through the Japanese occupation to the surrender of the Japanese empire. Lost Names is at once a loving memory of family and a vivid portrayal of life in a time of anguish.

How to Lie with Maps Mark Monmonier 2014-12-10 Originally published to wide acclaim, this lively, cleverly illustrated essay on the use and abuse of maps teaches us how to evaluate maps critically and promotes a healthy skepticism about these easy-to-manipulate models of reality. Monmonier shows that, despite their immense value, maps lie. In fact, they must. The second edition is updated with the addition of two new chapters, 10 color plates, and a new foreword by renowned geographer H. J. de Blij. One new chapter examines the role of national interest and cultural values in national mapping organizations, including the United States Geological Survey, while the other explores the new breed of multimedia, computer-based maps. To show how maps distort, Monmonier introduces basic principles of mapmaking, gives entertaining examples of the misuse of maps in situations from zoning disputes to census reports, and covers all the typical kinds of distortions from deliberate oversimplifications to the misleading use of color. "Professor Monmonier himself knows how to gain our attention; it is not in fact the lies in maps but their truth, if always approximate and incomplete, that he wants us to admire and use, even to draw for ourselves on the facile

screen. His is an artful and funny book, which like any good map, packs plenty in little space."—Scientific American "A useful guide to a subject most people probably take too much for granted. It shows how map makers translate abstract data into eye-catching cartograms, as they are called. It combats cartographic illiteracy. It fights cartophobia. It may even teach you to find your way. For that alone, it seems worthwhile."—Christopher Lehmann-Haupt, The New York Times ". . . witty examination of how and why maps lie. [The book] conveys an important message about how statistics of any kind can be manipulated. But it also communicates much of the challenge, aesthetic appeal, and sheer fun of maps. Even those who hated geography in grammar school might well find a new enthusiasm for the subject after reading Monmonier's lively and surprising book."—Wilson Library Bulletin "A reading of this book will leave you much better defended against cheap atlases, shoddy journalism, unscrupulous advertisers, predatory special-interest groups, and others who may use or abuse maps at your expense."—John Van Pelt, Christian Science Monitor "Monmonier meets his goal admirably. . . . [His] book should be put on every map user's 'must read' list. It is informative and readable . . . a big step forward in helping us to understand how maps can mislead their readers."—Jeffrey S. Murray, Canadian Geographic

The Domain of Images James Elkins 2018-08-06 In the domain of visual images, those of fine art form a tiny minority. This original and brilliant book calls upon art historians to look beyond their traditional subjects—painting, drawing, photography, and printmaking—to the vast array of "nonart" images, including those from science, technology, commerce, medicine, music, and archaeology. Such images, James Elkins asserts, can be as rich and expressive as any canonical painting. Using scores of illustrations as examples, he proposes a radically new way of thinking about visual analysis, one that relies on an object's own internal sense of organization. Elkins begins by demonstrating the arbitrariness of current criteria used by art historians for selecting images for study. He urges scholars to adopt, instead, the far broader criteria of the young field of image studies. After analyzing the philosophic underpinnings of this interdisciplinary field, he surveys the entire range of images, from calligraphy to mathematical graphs and abstract painting. Throughout, Elkins blends philosophic analysis with historical detail to produce a startling new sense of such basic terms as pictures, writing, and notation.

Map Projections Erik W. Grafarend 2014-09-11 In the context of Geographical Information Systems (GIS) the book offers a timely review of Map Projections. The first chapters are of foundational type. We introduce the mapping from a left Riemann manifold to a right one specified as conformal, equiaerial and equidistant, perspective and geodetic. In particular, the mapping from a Riemann manifold to a Euclidean manifold ("plane") and the design of various coordinate systems are reviewed. A speciality is the treatment of surfaces of Gaussian curvature zero. The largest part is devoted to the mapping the sphere and the ellipsoid-of-revolution to tangential plane, cylinder and cone (pseudo-cone) using the polar aspect, transverse as well as oblique aspect. Various Geodetic Mappings as well as the Datum Problem are reviewed. In the first extension we introduce optimal map projections by variational calculus for the sphere, respectively the ellipsoid generating harmonic maps. The second extension reviews alternative maps for structures, namely torus (pneu), hyperboloid (cooling tower), paraboloid (parabolic mirror), onion shape (church tower) as well as clothoid (High Speed Railways) used in Project Surveying. Third, we present the Datum Transformation described by the Conformal Group C10 (3) in a threedimensional Euclidean space, a ten parameter conformal transformation. It leaves infinitesimal angles and distance ratios equivariant. Numerical examples from classical and new map projections as well as twelve appendices document the Wonderful World of Map Projections.

Principles of Map Design Judith A. Tyner 2017-09-12 This authoritative, reader-friendly text presents core principles of good map design that apply regardless of production methods or technical approach. The book addresses the crucial questions that arise at each step of making a map: Who is the audience? What is the purpose of the map? Where and how will it be used? Students get the knowledge needed to make sound decisions about data, typography, color, projections, scale, symbols, and nontraditional mapping and advanced visualization techniques. Pedagogical Features: *Over 200 illustrations (also available at the

companion website as PowerPoint slides), including 23 color plates
 *Suggested readings at the end of each chapter. *Recommended Web
 resources. *Instructive glossary

Thinking with Maps Bertram C. Bruce 2021-05-15 Thinking with Maps
 takes readers on a journey through both traditional and modern mapping
 in order to learn how to conceive of mapping as fundamental to cognition
 and, thus, to what it means to be human. Each chapter considers an
 aspect of how we use maps. Examples from around the world show how
 learning can be made more relevant.

Comparative Criticism: Volume 2, Text and Reader Elinor Shaffer

 direction forwards.

The Visible Word Breslauer Professor of Bibliographical Studies at the
 Graduate School of Education & Information Studies Johanna Drucker
 1994-06-25 Drucker skillfully traces the development of this critical
 position, suggesting a methodology closer to the actual practices of the
 early avant-garde artists based on a rereading of their critical and
 theoretical writings. After reviewing theories of signification, the
 production of meaning, and materiality, she analyzes the work of four
 poets active in the typographic experimentation of the 1910s and 1920s:
 Ilia Zdanevich, Filippo Marinetti, Guillaume Apollinaire, and Tristan
 Tzara. Drucker explores the context for experimental typography in
 terms of printing, handwriting, and other practices concerned with the
 visual representation of language. Her book concludes with a brief look
 at the ways in which experimental techniques of the early avant-garde
 were transformed in both literary work and in applications to commercial
 design throughout the 1920s and early 1930s.

Space Image Processing Julio Sanchez 2018-12-19 Space Image
 Processing covers the design and coding of PC software for processing
 and manipulating imagery obtained by satellites and other spacecraft.
 Although the contents relate to several scientific and technological fields,
 it serves as a programming book, providing readers with essential
 technical information for developing PC applications. The material
 focuses on images of the planet and other celestial bodies obtained by
 orbiting and non-orbiting spacecraft. This book is not about raster
 graphics in general, but about raster graphics processing as it applies to
 space imagery. Three parts divide the text: 1. Science - background at an
 introductory level - scientific principles underlying space imagery and its
 processing - topics related to space and remote sensing. 2. Technology -
 topics related to space imagery - geodesy, cartography, image data
 formats, image processing. 3. Programming - code examples for DOS and
 Windows programming on the PC - consideration of low-level and C++
 code - routines with a tutorial and demonstrative purpose.

Mallarmé and the Poetics of Everyday Life Hélène Stafford 2022-06-08
 This book is concerned with the relocation of the concept of the ordinary
 within the works of Stéphane Mallarmé (1842-98). It engages with much
 of Mallarmé's oeuvre, concentrating on the textual features which reveal
 that, even in his most difficult texts, the ordinary as conceptual tool, as
 textual matter and as contemporary environment is never dismissed, but
 re-invented and invested with new and lively meaning. The instability of
 the concept in the texts, its qualities which range from the threatening to
 the immensely fertile make it a particularly rewarding area of study,
 against the background of a critical corpus which has in the past seen

Mallarmé's work at best as unconcerned with ordinary life, at worst as
 irremediably removed from it. Here is presented for the first time a study
 of a metalanguage which appears surprisingly frequently in the Mallarmé
 corpus. The complex metaphorisation of the banal in Mallarmé's oeuvre,
 as well as the ideological discourse of the journalistic writings in their
 engagement with contemporary life are analysed and contribute to the
 demonstration of the existence within the corpus of an idealised ordinary
 world re-invented by the poet.

Geography for Nongeographers Frank R. Spellman 2010-03-16

Geography is a multidisciplinary field which looks at both physical and
 social aspects of the world. The broad scope of the field makes it a
 daunting area for those who do not have a specific background in it.
 Geography for Non-Geographers thus introduces readers to the most
 important aspects of geography and how they affect us. It covers all
 areas of geography, from physical geography to climate and weather to
 human and cultural geography. Geography for Non-Geographers is
 presented in an accessible and straightforward manner, explaining
 scientific concepts in the most basic way possible. Along with basic
 geographical principles, the text provides a clear, concise presentation of
 the consequences of the physical interactions with the environment we
 inhabit. Each chapter ends with a chapter review test to help evaluate
 mastery of the concepts presented. Readers acquire an understanding of
 and skill in geographical principles, adding a critical component to their
 professional knowledge.

Edmond Halley Alan H. Cook 1998 Edmond Halley (1656-1742), MA,
 LLD, FRS, Capt. RN, Savillian Professor of Geometry and Astronomer
 Royal, stands pre-eminent among Oxford, English, and European
 scientists. A contemporary of Wren, Pepys, Hooke, Handel, Purcell, and
 Dryden, he was a schoolboy in London while the Great Fire raged, and
 was an active participant in the Enlightenment, an age of profound
 developments in all the arts and sciences. As a younger contemporary of
 Isaac Newton, he had a crucial part in the Newtonian revolution in the
 natural sciences. It was Halley who set the question that led Newton to
 write the Principia, and who edited, paid for, and reviewed it. In later
 years he applied the methods of the Principia widely in astronomy and
 geophysics. Now more widely known for his prediction of the return of
 "his" comet, Halley discovered the proper motion of stars, made
 important studies of the moon's motion, and his investigations of the
 Earth's magnetic field and of tides were unrivalled for centuries. His
 prediction of the transit of Venus led to Cook's voyage to Tahiti. He was
 far more than an cloistered academic; his exploits as a naval captain led
 to perilous adventures, and he was also a notable servant of the State.
 Much material about his eventful career has come to light in recent
 years, making this a timely new account of the life, scientific interests,
 and continuing influence of this engaging and adventurous scholar. Sir
 Alan Cook has written a fascinating and illuminating account of Halley's
 life and science, making this a unique and highly readable biography of
 one of the key figures of his time.

Mapping Latin America Jordana Dym 2011-12-01 For many, a map is
 nothing more than a tool used to determine the location or distribution of
 something—a country, a city, or a natural resource. But maps reveal
 much more: to really read a map means to examine what it shows and
 what it doesn't, and to ask who made it, why, and for whom. The
 contributors to this new volume ask these sorts of questions about maps
 of Latin America, and in doing so illuminate the ways cartography has
 helped to shape this region from the Rio Grande to Patagonia. In
 Mapping Latin America, Jordana Dym and Karl Offen bring together
 scholars from a wide range of disciplines to examine and interpret more
 than five centuries of Latin American maps. Individual chapters take on
 maps of every size and scale and from a wide variety of
 mapmakers—from the hand-drawn maps of Native Americans, to those
 by famed explorers such as Alexander von Humboldt, to those produced
 in today's newspapers and magazines for the general public. The maps
 collected here, and the interpretations that accompany them, provide an
 excellent source to help readers better understand how Latin American
 countries, regions, provinces, and municipalities came to be defined,
 measured, organized, occupied, settled, disputed, and understood—that
 is, how they came to have specific meanings to specific people at specific
 moments in time. The first book to deal with the broad sweep of mapping
 activities across Latin America, this lavishly illustrated volume will be
 required reading for students and scholars of geography and Latin
 American history, and anyone interested in understanding the

significance of maps in human cultures and societies.
