Astrophotography is Easy! Gregory I. Redfern 2020-10-29 There are many books covering different facets of astrophotography, but few of

them contain all the necessary steps for beginners in one accessible place.

Astrophotography is Easy! fills that void, serving as a guide to anybody interested in the subject but starting totally from scratch. Assuming no prior experience, the author runs through the basics for how to take astrophotos using just a camera—including cell phones and tablets—as well as a telescope and more sophisticated equipment. The book includes proven techniques, checklists, safety guidelines, troubleshooting tips, and more. Each chapter builds upon the last, allowing readers to master basic techniques before moving on to more challenging material. Also included is a comprehensive list of additional books and resources on a variety of topics so readers can continue expanding their skills.

Astrophotography Is Easy! doesn't simply teach you the basic skills for becoming an astrophotographer: it provides you with the foundations you will need for a lifelong pursuit.

Sky & Telescope's Moon Map Sky Publishing 2007-05 Our striking map of the Moon's near side identifies more than 300 features on a new, easy-to-read mosaic image. The Moon is shown with north up, the way it appears in binoculars. It's also available in a mirror-reversed format for use with telescopes with an odd number of reflections (such as refractors and catadioptrics with star diagonals.) Both are great for use at the telescope too! Lunar disk is 10{1/2} inches in diameter.

21st Century Atlas of the Moon Charles Arthur Wood 2012-12 "The 21st Century Atlas of the Moon is uniquely designed for the backyard, amateur astronomer. As an indispensable guide to telescopic moon observation, it can be used at the telescope or as a desk reference. It is both accessible to the novice and valuable to the expert. With over two hundred Lunar Reconnaissance Orbiter images, the highest quality images of the moon ever taken, this atlas illustrates the Moon in high resolution. With

special maps of the limb and far side, LRO altimetry-based images of major basins and their mare ridge, and maps of the Apollo and Soviet landing sites, this guide offers a level of detail never before seen in an atlas of the Moon. The Atlas clearly provides unprecedented detail on more than one thousand named Moon features while recommending additional features and images to observe." -- Publisher's website.

Binocular Highlights Gary Seronik 2017
Binocular Highlights is a tour of 109 different celestial sights--from softly glowing clouds of gas and dust to unusual stars, clumps of stars, and vast star cities (galaxies)--all visible in binoculars. Each object is plotted on a detailed, easy-to-use star map, and most of these sights can be found even in a light-polluted sky. Also included are four seasonal all-sky charts that help locate each highlight. You don't need fancy or expensive equipment to enjoy the wonders of the night sky. In fact, as even experienced stargazers know, to go beyond the naked-eye sky

and delve deep into the universe, all you need is a pair of binoculars--even the ones hanging unused in your closet. If you don't own any, Binocular Highlights explains what to look for when choosing binoculars for stargazing and provides observing tips for uses of these portable and versatile mini-telescopes.

The Six-Inch Lunar Atlas Don Spain
2009-10-03 Here is a lunar atlas designed specifically for use in the field by lunar observers. Its title - The Six-inch Lunar Atlas - refers both to the aperture of the telescope used to make the images in the book, and also to the book's physical size: so it's perfect for fitting into an observer's pocket! The author's own lunar photographs were taken with a 6-inch (150mm) telescope and CCD camera, and closely match the visual appearance of the Moon when viewed through a modest (3-inch to 8-inch) telescope. (Depending on seeing, of course.) Each picture is shown oriented "as the Moon really is" when viewed from the northern

hemisphere, and is supplemented by exquisite computer sketches that list the main features. Two separate computer sketches are provided to go with each photograph, one oriented to appear as seen through an SCT telescope (e.g. the Meade and Celestron ranges), the other oriented for Newtonian and refracting telescopes. It is worth commenting that most observers find it extremely difficult to identify lunar features when using a conventional atlas and SCT telescope - the human brain is very poor at making "mirror-image" visual translations. There is a page of descriptions for the salient features in each photograph.

Philip's Moon Map George Philip & Son 2003
Philip's Moon Map is a large-format folded map of the near side of the Moon. It has been specially drawn for Philip's by Dr John Murray, a research lecturer at the Open University, who is an expert on the lunar surface. The map is not only a highly accurate and clear representation of the Moon, but is also a practical guide for

lunar observers. More than 500 physical features - craters, seas, mountain ranges, peaks, valleys and rilles (elongated depressions) - are named and indexed, and the landing sites of unmanned and manned spacecraft are also marked. The observer can thus readily identify objects seen through binoculars or a telescope, or select targets for a programme of observation. The chart includes a small map of the far side of the Moon (never visible from the Earth) and is accompanied by a practical guide to lunar observing. This concise and informative text describes the various types of feature to observe, illustrated with drawings and photographs. Tips are given as to the best point in the lunar cycle to observe the most interesting of these features. Guidelines on drawing or photographing the Moon are also included. Colour artworks explain the Moon's orbit, and why its phase (the proportion of the Moon that is visible from Earth) changes during the course of a month. Also explained, with the

help of illustrations, are the path of the Moon during the course of the year and why lunar and solar eclipses occur.

Night Sky Atlas Robin Scagell 2017-02-07
"Maps and text show stars, planets and other objects in the sky night, all visible with binoculars or a small telescope. Photo-realistic images opposite maps show how the same portion of sky looks to the naked eye, allowing less experienced observers to quickly find specific sky objects of interest. The maps can be used for planning observations, navigating from one part of the sky to another, and for quick reference. The guide can be used anywhere in the world and at any time of the year. The maps include observing targets, seasonal maps, and magnitude 5.5 star maps. Additional features are a plastic-laminated lay-flat binding for outdoor use, flaps to use as page markers, constellation maps, relief Moon maps, and a quick-access page-referenced constellation listing on the back flap."--

The Hatfield Photographic Lunar Atlas Jeremy Cook 2012-12-06 The Hatfield Photographic Lunar Atlas has been long regarded as the finest photographic lunar atlas available and remains as a model of accuracy and clarity. This fully revised version is completely updated with new maps, names and technical data. The superb large-scale photographic plates and the accompanying full-scale maps make this an exceptionally easy-to-use lunar atlas for the field or observatory.

Philip's Moon Map 2014-09-01 In a convenient folded format, Philip's Moon Map is a superbly detailed, large-format map of the near (visible) side of the Moon. Specially drawn for Philip's by Dr John Murray, an expert on the lunar surface,

the map is not only a highly accurate and clear representation of the Moon but is also a practical guide for lunar observers. More than 500 physical features - craters, seas, mountain ranges, peaks, valleys and rilles (elongated depressions) - are named and indexed, and the landing sites of unmanned and manned spacecraft are also marked. The observer can thus readily identify objects seen through binoculars or a telescope, or pick targets for a programme of observation. The accompanying text is a practical guide to Moonwatching, which explains how to use the map and highlights the most interesting lunar features. Close-up images of some of these objects show what the observer can expect to see. Also included are photographs of the Moon at each daily stage and a smaller map of the far side, as revealed by satellites. Guidelines on drawing or photographing the Moon are also included.

Sky & Telescope's Mirror-Image Moon Map
Sky Publishing 2007-05 We've flipped the Moon

Sky & Telescope's Planisphere 50° North Sky Publishing 2007-05 Here's an all-sky map that's good anytime throughout the year. Sky & Telescope's Star Wheel features the iconic S&T monthly star chart, replotted as a planisphere, complete with accurately marked star brightnesses and locations of famous deep-sky objects. The back offers a companion chart that shows a less distorted view of the sky to the south. The full-color, laminated Star Wheel is easy to read in daylight or at night under a red flashlight. It even accommodates daylight-saving time.

Exploring the Moon David M. Harland 2008-04-16 In this comprehensive overview of Man's relationship with his planet's nearest neighbor, David Harland opens with a review of

the robotic probes, namely the Rangers which returned television before crashing into the Moon, the Surveyors which 'soft landed' in order to investigate the nature of the surface, and the Lunar Orbiters which mapped prospective Apollo landing sites. He then outlines the historic landing by Apollo 11 and the final three missions of comprehensive geological investigations. He concludes with a review of the robotic spacecraft that made remote-sensing observations of the Moon. This Commemorative Edition includes a foreword by one of the original astronauts as well as an extra section reviewing the prospect of renewed exploration there. New graphics and images are also included.

Sky & Telescope's Field Map of the Moon Gary Seronik 2005-06 The only moon reference you'll need at the telescope! Using maps drawn by renowned lunar cartographer Antonin Rukl, you'll be able to find and identify craters, lava flows, mountains and more. The unique design allows you to look at the entire moon, individual

quarters or any two neighboring quarters at the same time, and the durable lamination will protect your map from dew, spills, and everyday wear and tear for years to come.

Mirror-Image Moon Map Sky Publishing 2007-05 We've flipped the Moon to show a mirror-reversed, north-up lunar disk, as it appears in telescopes with an odd number of reflections. (If your telescope setup shows the Moon mirror-reversed with south up, turn this map upside down.)

Sketching the Moon Richard Handy 2011-12-11 For anyone artistically inclined, observing the Moon and attempting to sketch or paint it can easily become a passion. The Moon presents a broad array of tone, texture, and form.

Capturing this in a painting or sketch at the eyepiece of a telescope - or even with binoculars - develops observational skills, leaves a record of the observation, and can also be a delightful and rewarding pastime. However, the choice of media available is extensive (acrylic paint, oils,

pen, charcoal, etc., and even computer art programs), and there is no existing text that fully explains all lunar sketching and painting techniques in each respective medium. This beautiful and graphically rich book fulfills this requirement. It presents detailed step-by-step instructions, in the form of illustrated tutorials for every major medium employed to represent the Moon. It also provides practical advice on how to sketch outdoors at night (not ideal conditions for an artist!). This is easily the most extensive book on the subject of lunar art for amateur astronomers, particularly those observing through a telescope. The diverse features of the lunar surface will attract and entice readers to review the number of different media presented, exciting and inspiring them with the possibilities of learning to depict all of the fascinating aspects of Earth's very own satellite.

Scientific Star and Planet Locator Chaisson 2002-08 This famous rotating roadmap of the

heavens shows the location of the stars, constellations, and planets relative to the horizon for the exact hour and date you determine. This 8-inch square star chart was plotted by the late astronomer and cartographer George Lovi. The reverse side of the locator is packed with additional data on the planets, meteor showers, and bright stars. Included with each star chart is a 16-page, fully-illustrated, pocket-size instruction booklet.

The Hatfield SCT Lunar Atlas Anthony Cook
2013-10-11 In 2004, it became obvious that Henry Hatfield's original atlas wasn't suitable for all current commercially-made amateur telescopes. Newtonian telescopes and astronomical refractors - for many years the only choice for amateurs - invert the observed image. The standard Hatfield Atlas therefore follows the IAU (International Astronomical Union) convention of having maps (and photographs) with South at the top and West on the left: an inverted image. However, the

current ranges of Schmidt-Cassegrain and Maksutov telescopes - that's most of those manufactured by Meade, Celestron, and many others - don't invert the observed image but instead reverse it left-for-right. That's with North at the top and East on the left. Because of the way the human visual system works, it is almost impossible to mentally 'mirror-image' a map to compare it with the view through the eyepiece, so even turning an IAU-standard atlas upside-down doesn't help! This new SCT version of the Atlas solves this problem for observers. Identification of lunar features is made quick and easy. The new, digitally re-mastered second edition vastly improves the clarity and definition of the original photographs - significantly beyond the resolution limits of the photographic grains present in earlier atlas versions - whilst preserving the layout and style of the original publications. This has been achieved by merging computer-visualized Earth-based views of the lunar surface, derived from NASA's Lunar

Reconnaissance Orbiter data, with scanned copies of Commander Hatfield's photographic plates, using the author's own software. The result is a The Hatfield SCT Lunar Atlas for 21st century amateur telescopes up to and beyond 12-inch aperture. It contains all the features that made the original so widely used: a combination of an index of all International Astronomical Union named primary lunar features, and twelve chart areas help to locate any named lunar features of interest that can each be examined under typically five different states of illumination. Close ups of interesting features are also included. The new Atlas is supplemented by an introduction to its use, a short description of the digital re-mastering technique, and a completely new section describing lunar observing techniques. At the end of the atlas there is an index of all named features and crater diameters, along with a summary table of the dates and times that the original Hatfield images represent.

The Cambridge Star Atlas Wil Tirion 2011-01-27
This classic star atlas is ideal for both beginning astronomers and more experienced observers worldwide. The clear, full-color maps show stars, clusters and galaxies visible with binoculars or a small telescope. The atlas also features constellation boundaries and the Milky Way, and lists objects that are interesting to observe. This new edition features a clearer map of the Moon's surface, showing craters and features; a second Moon map, mirror reversed for users of telescopes with star diagonals; enhanced index charts showing the constellations more clearly; and a new data table listing stars hosting planetary systems. It is now spiral bound, making it ideal for use at the telescope.

The Monthly Sky Guide Ian Ridpath
2012-12-10 The ninth edition of Ian Ridpath and Wil Tirion's famous guide to the night sky is

updated with planet positions and forthcoming eclipses to the end of the year 2017. It contains twelve chapters describing the main sights visible in each month of the year, providing an easy-to-use companion for anyone wanting to identify prominent stars, constellations, star clusters, nebulae and galaxies; to watch out for meteor showers ('shooting stars'); or to follow the movements of the four brightest planets, Venus, Mars, Jupiter and Saturn. Most of the sights described are visible to the naked eye and all are within reach of binoculars or a small telescope. This revised and updated edition includes sections on observing the Moon and the planets, with a comprehensive Moon map. The Monthly Sky Guide offers a clear and simple introduction to the skies of the northern hemisphere for beginners of all ages.

Atlas of the Moon Antonín Růkl 2004 The definitive moon atlas, revised, updated and improved with expanded text and maps. The ideal moon reference guide for beginning Moon-gazers and expert lunar observers alike. Master lunar cartographer Antonin Rukl's exquisite maps are accompanied by comprehensive lists of lunar formations and sights. The printing is free of red ink, making it easy to use at the telescope. English-language version published exclusively by Sky Publishing. 224 pages, 8 1/2 by 11 3/4 inches, hardcover.

Mapping and Naming the Moon Ewen A. Whitaker 2003-12-11 Almost 30 years after the Apollo missions, 'Tranquillity Base', 'Hadley Rille', or 'Taurus-Littrow' are names still resonant with the enormous achievements represented by the lunar landings. But how did these places get their names? Who named Copernicus Crater? Where did all those names

on lunar maps come from, and what stimulated their selection? Ewen Whitaker traces the origins and evolution of the present-day systems for naming lunar features, such as craters, mountains, valleys and dark spots. The connections between the prehistoric and historic names, and today's gazetteer are clearly described. Beautiful lunar maps spanning four centuries of progress wonderfully illustrate the unfolding of our ability to map the Moon. Rare, early, photographs add to the sense of history. Comprehensive appendices and the bibliography make this delightful book a work of lasting reference and scholarship.

FAQs About Finding Sky Telescopes Moon Map Laminated eBooks

How do I know which eBook platform is the best for me?

Finding the best eBook platform depends on your reading preferences and device compatibility. Research different platforms, read user reviews, and explore their features before making a choice.

Are free eBooks of good quality?

Yes, many reputable platforms offer high-quality free eBooks, including classics and public domain works. However, make sure to verify the source to ensure the eBook credibility.

Can I read eBooks without an eReader?

Absolutely! Most eBook platforms offer web-based readers or mobile apps that allow you to read eBooks on your computer, tablet, or

smartphone.

How do I avoid digital eye strain while reading eBooks?

To prevent digital eye strain, take regular breaks, adjust the font size and background color, and ensure proper lighting while reading eBooks.

What the advantage of interactive eBooks?

Interactive eBooks incorporate multimedia elements, quizzes, and activities, enhancing the reader engagement and providing a more immersive learning experience.
