RNA-Protein Interactions : A Practical Approach
Christopher W.J. Smith 1998-07-09 RNA-protein interactions play a fundamental role in gene expression and protein synthesis. Recent research into the role of RNA in cells has elucidated many more vital interactions with proteins. This book provides an up-to-date and comprehensive guide to a wide range of laboratory procedures to investigate the interactions between RNA and proteins. -;RNA-protein interactions play a vital role in gene transcription and protein expression. Interactions such as the synthesis of mRNA by RNA polymerases, to the essential modification of RNA

by the proteins of the spliceosome complex, and the highly catalytic action of the ribosome in protein synthesis, are established as being fundamental to the function of RNA. Recent research into, for example, the role of RNA as a catalyst, has elucidated many more interactions with proteins that are vital to cell function. RNA - Protein Interactions: A Practical Approach provides a clear and comprehensive guide to the experimental procedures used in studying RNA - protein interactions. The approaches covered range from those initially used to detect a novel RNA-protein interaction, various biochemical and genetic approaches to purifying and cloning RNA binding proteins, through to methods for an in depth analysis of the structural basis of the interaction. The volume includes a number of procedures that have not previously been covered in this type of manual. These include the production of site-specifically modified RNAs by enzymatic and chemical methods and in vivo screening for novel RNA - protein interactions in yeast and E. coli . This is the first volume to gather in one place this wide array of approaches for studying RNA - protein interactions. As is customary for the Practical Approach series, the writing is characterized by a clear explanatory style with many detailed protocols. This informative book will be a valuable aid to laboratory workers in biochemistry and molecular biology - graduate students, postdoctoral and senior scientists - whose research encompasses this field. -

Extracellular Matrix M. A. Haralson 1995 Studies of the extracellular matrix (the material that surrounds cells and tissues) span much of modern biological research. In addition to providing structure to organisms the extracellular matrix is crucial in determining cell growth, how the cell responds during injury and development and what the cell makes. Changes in the extracellular matrix are important components in both inherited and acquired diseases such as diabetes and cancer. This important volume brings together undera single cover the majority of techniques currently employed in extracellular matrix research and will serve as an indispensable resource for researchers and clinicians in this field.

Cytoskeleton: Signalling and Cell Regulation Kermit Carraway 1999-12-16 This book provides descriptions of experimental methods in research on the cytoskeleton and its relationships to signaling and cell regulation. Thus, it bridges two active and

fertile areas of research. The focus is directed particularly towards methods which take advantage of recent advances in molecular biology, microscopy and immunological assays. A second emphasis is on methods for understanding dynamic changes in cells. A third emphasis is on the formation and turnover of macromolecular and supramolecular complexes, which are so important in driving cell regulation and the behaviour of cytoskeletal elements. A combination of practical advice and detailed protocols should make this book valuable for both novice and experienced workers in these burgeoning fields.

Cell Separation Gillian, Derek Francis Fisher 1998 Isolating specific cells or fractionating viable cell populations is an essential step of many of the techniques used across a wide range of biological and related disciplines. This text aims to inform those working in all areas of the biological sciences of the methods which are available to them and which is likely to be the most useful.; The contributing authors have provided a comprehensive guide to the methods used to prepare cell suspensions and to separate viable cells depending on their different characteristics - such as size, density, surface charge and immunological identity. Each chapter offers direct practical guidance for the various techniques and describes the advantages and limitations of each. Reproducible protocols, hints and tips for success and troubleshooting suggestions are provided.

Subcellular Components G. D. Birnie 1972

Methods of Cell Separation Paul T. Sharpe 1988 Methods of Cell Separation brings to the attention of researchers at all levels the variety of methods available for separating viable populations of cells. Methods are grouped into 3 categories based on the criteria of separation, namely; size or density; non-specific surface properties; and specific surface properties. The principle of each method is described

together with general and, where possible, specific protocols for conducting cell separation experiments. A central theme of the book is the separation of populations of blood lymphocytes which is used as an example for each method. Methods of Cell Separation is distinguished by three powerful assets: descriptions of the majority of cell separation methods currently being used; details of the experimental procedures involved in each method; and comparisons of the different methods for separating cell populations with particular reference to blood lymphocytes. An excellent addition to a distinguished series, and extremely useful as a laboratory manual.

Protein Purification Protocols Paul Cutler 2008-02-02 The first edition of Protein Purification Protocols (1996), edited by Professor Shawn Doonan, rapidly became very successful. Professor Doonan achieved his aims of p- ducing a list of protocols that were invaluable to newcomers in protein purification and of significant benefit to established practitioners. Each chapter was written by an ex-rienced expert in the field. In the intervening time, a number

of advances have w- ranted a second edition. However, in attempting to encompass the recent developments in several areas, the intention has been to expand on the original format, retaining the concepts that made the initial edition so successful. This is reflected in the structure of this second edition. I am indebted to Professor Doonan for his involvement in this new edition and the continuity that this brings. Each chapter that appeared in the original volume has been reviewed and updated to reflect advances and bring the topic into the 21st century. In many cases, this reflects new applications or new matrices available from vendors. Many of these have increased the performance and/or scope of the given method. Several new chapters have been introduced, including chapters on all the currently used protein fractionation and ch- matographic techniques. They introduce the theory and background for each method, providing lists of the equipment and reagents required for their successful execution, as well as a detailed description of how each is performed.

Subnuclear Components G. D. Birnie 2016-01-21

Subnuclear Components: Preparation and Fractionation focuses on the isolation of subnuclear components of eukaryotic cells. The book first discusses the isolation of nuclear envelopes from whole tissues. Topics include nuclear envelope in situ; general consideration and evaluation of isolation methods; and nuclear envelope isolation methods. The text describes the isolation of nucleoli, including the isolation of nucleoli from oocytes, nuclei, and physarum, and isolation of plant nucleoli. The book focuses on the preparation, characterization, and fractionation of chromatin. Emphasis is on the preparation of chromatin from interphase and metaphase cells; contaminants of chromatin; characteristics of isolated chromatin; and dissociation and reassociation of chromatin.

The text also discusses fractionation and isolation of histones, including the preparation of individual histone fractions and isolation and purification of the five main histone fractions of calf thymus during one preparation. The book also looks at the preparation and properties of chromatin non-histone proteins, including isolation of nuclear RNA and isolation of DNA from eukaryotic cells. The selection is a good source of data for readers interested in the isolation of subnuclear constituents of eukaryotic cells.

Cell Separation Methods and Applications Diether Recktenwald 1997-11-04 "Offers complete coverage and assessment of cell separation technologies for analytical and preparative isolations of biological cell populations-demonstrating how to select and devise optimal sorting strategies for applications in biochemistry, immunology, cell and molecular biology, and clinical research. "

Subcellular Fractionation J. M. Graham 1997-01-30 Many investigations into the structure and function of cells and tissues require the isolation of a particular membrane or subcellular component (organelle). This book covers all the necessary aspects, from breaking up the cells (homogenization), via a variety of separation techniques (the isolation and fractionation chapters), to characterization of the separated organelles.

Essential Cell Biology Vol 1 John Davey 2003-06-05 Volume 1 of this two volume set focuses on techniques for studying cell structure. It describes light and electron microscopy, subcellular fractionation, protein purification and analysis, nucleic acid analysis, lipid analysis, and investigations of the cytoskeleton. Volume 2 concentrates on understanding how cells function. It describes a range of key investigations of cell function including analyses of gene expression, the cell

cycle, cellular bioenergetics, transport across the nuclear membrane and the ER membrane, endosome transport, receptors, and signal transduction.

Subcellular Fractionation Paul R. Pryor 2015 Eukaryotic cells are remarkably complex structures, containing a vast repertoire of macromolecules, organelles, and other compartments that orchestrate the tasks required for life. For in-depth studies of their function and composition, reliable methods for the isolation of specific subcellular structures are often required. This laboratory manual provides step-by-step protocols for the extraction of subcellular components from animal tissues, yeasts, plants, and cultured cells. Each chapter focuses on a particular eukaryotic organelle, vesicle, membrane, or macromolecular complex. Strategies for breaking cells while maintaining the structural and functional integrity of the component of interest, enriching for that component based on its physical and biochemical characteristics, and monitoring and ensuring the success of the purification procedure are provided. The contributors describe both traditional approaches (e.g., density gradient centrifugation) and innovative techniques (e.g., the use of SPIONs) for isolating subcellular constituents. This manual is therefore an essential laboratory resource

for all cell biologists seeking a comprehensive collection of dependable subcellular fractionation methods.

Quantitative Proteomics Claire E Eyers 2014 As a component of post-genome science, the field of proteomics has assumed great prominence in recent years. Whereas quantitative analyses focussed initially on relative quantification, a greater emphasis is now placed on absolute quantification and consideration of proteome dynamics. Coverage of the topic of quantitative proteomics requires consideration both of the analytical fundamentals of quantitative mass spectrometry and the specific demands of the problem being addressed. Quantitative Proteomics aims to outline the state of the art in mass spectrometry-based quantitative proteomics, describing recent advances and current limitations in the instrumentation used, together with the various methods employed for generating high quality data. Details on both strategies describing how stable isotope labelling can be applied and methods for performing quantitative analysis of proteins in a label-free manner are given. The utility of these strategies to understanding cellular protein dynamics are then exemplified with chapters looking at spatial proteomics, dynamics of protein function as determined by quantifying changes in protein post-translational modification and protein turnover. Finally, a key application of these techniques to biomarker discovery and validation is presented, together with the rapidly developing area of quantitative analysis of protein-based foodstuffs. This exemplary book is essential reading for analytical and biological mass spectrometrists working in proteomics research, as well as those undertaking either fundamental or clinical-based investigations with an interest in understanding protein dynamics and/or biomarker assessment.

The book includes theories and answers to questions that are relevant to the study. The first chapter of the book details various facts about homogenization of mammalian cells. This chapter presents the results of studies on solid tissues and single-cell suspensions; the author then offers his conclusion of the study. The next two chapters highlight the methods on isolating nuclei, including the guides for standard assessment and the procedure of isolation,

along with analysis of nuclei biochemical properties. The main topics in Chapter 4 are mitochondria from animal tissues and yeasts; this chapter also discusses the preparation for a rat-liver, blowfly flight-muscle, yeast, and brain mitochondria. The chapter that follows widely talks about lysosomes, including its historical background, centrifugal method, and related topics. In the next several chapters, the topics covered include purification, isolation, preparation, and separation of cells including plasma-membrane, polysomes, ribosomes, microsomes, and microvilli. The book serves as a great reference for undergraduates and postgraduates in the field, as it contains a thorough discussion of various relevant studies.
